AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1	1. (Currently amended) A method for checkpointing an application,
2	comprising:
3	dynamically linking an interceptor library into the application during a
4	run-time invocation of the application, wherein the run-time invocation occurs
5	after the application has been compiled and linked, and wherein the interceptor
6	library is dynamically linked by simply setting an environment variable, without
7	having to perform an entire static linking process;
8	intercepting a function call produced by the application at the interceptor
9	library;
10	recording parameters of the function call to create a checkpoint that
11	includes information about the function call parameters;
12	making the function call by referring to function pointers saved within the
13	interceptor library;
14	receiving results of the function call; and
15	forwarding results of the function call back to the application.
1	2. (Original) The method of claim 1, further comprising creating a
2	checkpoint by:
3	stopping the application;
4	retrieving the recorded parameters;

5 saving the checkpoint data, including the recorded parameters, to 6 secondary storage; and resuming the application. 7 3. (Original) The method of claim 2, further comprising using the 1 checkpoint to restore the application. 2 4. (Original) The method of claim 2, wherein saving the checkpoint data to 1 2 secondary storage involves saving the checkpoint data to a persistent storage. 5. (Original) The method of claim 2, wherein saving the checkpoint data to 1 secondary storage involves saving the checkpoint data in a file system, or a 2 3 database. 6. (Original) The method of claim 1, wherein making the function call 1 involves referencing the function through a function pointer. 2 7. (Original) The method of claim 1, further comprising recording the 1 results of the function call to facilitate creating a checkpoint that includes 2 3 information about the results of the function call. 8. (Original) The method of claim 1, wherein the function calls can include 1 2 system calls or lib calls. 9. (Original) The method of claim 1, wherein the parameters can include: 1 2 file paths; 3 thread flags; and timer-thread relationships. 4

1	10. (Currently amended) A computer-readable storage medium storing
2	instructions that when executed by a computer cause the computer to perform a
3	method for checkpointing an application, the method comprising:
4	dynamically linking an interceptor library into the application during a
5	run-time invocation of the application, wherein the run-time invocation occurs
6	after the application has been compiled and linked, and wherein the interceptor
7	library is dynamically linked by simply setting an environment variable, without
8	having to perform an entire static linking process;
9	intercepting a function call produced by the application at the interceptor
10	library;
11	recording parameters of the function call to create a checkpoint that
12	includes information about the function call parameters;
13	making the function call by referring to function pointers saved within the
14	interceptor library;
15	receiving results of the function call; and
16	forwarding results of the function call back to the application.
1	11. (Original) The computer-readable storage medium of claim 10, further
2	comprising creating a checkpoint by:
3	stopping the application;
4	retrieving the recorded parameters;
5	saving the checkpoint data, including the recorded parameters, to
6	secondary storage; and
7	resuming the application.
1	12. (Original) The computer-readable storage medium of claim 11, further
2	comprising using the checkpoint to restore the application.

1	13. (Original) The computer-readable storage medium of claim 11,
2	wherein saving the checkpoint data to secondary storage involves saving the
3	checkpoint data to a persistent storage.
1	14. (Previously presented) The computer-readable storage medium of
2	claim 11, wherein saving the checkpoint data to secondary storage involves saving
3	the checkpoint data in a file system, or a database.
1	15. (Original) The computer-readable storage medium of claim 10,
2	wherein making the function call involves referencing the function through a
3	function pointer.
J	runction pointer.
1	16. (Original) The computer-readable storage medium of claim 10,
2	wherein the method further comprises recording the results of the function call to
3	facilitate creating a checkpoint that includes information about the results of the
4	function call.
1	17. (Original) The computer-readable storage medium of claim 10,
2	wherein the function calls can include system calls or lib calls.
1	18. (Original) The computer-readable storage medium of claim 10,
2	wherein the parameters can include:
3	file paths;
4	thread flags; and
5	timer-thread relationships.
_	variate to the same a s

1

2

3	a dynamic linking mechanism that is configured to dynamically link an
4	interceptor library into the application during a run-time invocation of the
5	application, wherein the run-time invocation occurs after the application has been
6	compiled and linked, and wherein the interceptor library is dynamically linked by
7	simply setting an environment variable, without having to perform an entire static
8	linking process;
9	an intercepting mechanism within the interceptor library that is configured
0	to intercept a function call produced by the application;
1	a recording mechanism that is configured to record parameters of the
2	function call to facilitate creating a checkpoint that includes information about the
3	function call parameters;
4	a calling mechanism that is configured to make the function call by
5	referring to function pointers saved within the interceptor library;
6	a receiving mechanism that is configured to receive results of the function
7	call; and
8	a forwarding mechanism that is configured to forward results of the
9	function call back to the application.
1	20. (Original) The apparatus of claim 19, further comprising a checkpoint
2	creation mechanism that is configured to:
3	stop the application;
4	retrieve the recorded parameters;
5	save the checkpoint data, including the recorded parameters, to secondary
6	storage; and to
7	resume the application.

1	21. (Original) The apparatus of claim 20, further comprising a restoration
2	mechanism that is configured to use the checkpoint data to restore the application
3	to the checkpointed state.
1	22. (Original) The apparatus of claim 20, wherein the checkpoint creation
2	mechanism is configured to save checkpoint data to a persistent storage.
1	23. (Original) The apparatus of claim 20, wherein the checkpoint creation
2	mechanism is configured to save the checkpoint data in a file system, or a
3	database.
1	24. (Original) The apparatus of claim 19, wherein the calling mechanism
1	
2	is configured to make the function call by referencing the function through a
3	function pointer.
1	25. (Original) The apparatus of claim 19, further comprising a recording
2	mechanism that is configured to record the results of the function call to facilitate
3	creating à checkpoint that includes information about the results of the function
4	call.
1	26. (Original) The apparatus of claim 19, wherein the function calls can
2	include system calls or lib calls.
1	27. (Original) The apparatus of claim 19, wherein the parameters can

include:

file paths;

thread flags; and

timer-thread relationships.
